

Traditional PSTN (Public Switched Telephone Network) lines - the common two-wire interface used in most domestic homes. This is adequate only for smaller systems, and can suffer from not being able to detect incoming calls when trying to make an outbound call.

AY Consulting supports the old legacy systems. Our voice telephony applications team will assess existing systems or design, install, and maintain a new system from the ground up. Our goal is to make sure the systems are easy to use and boost efficiency. We coordinate all aspects of the implementation process, as well as provide on-going service and support.
